

Students will write a “story” that shows someone going through the steps of the scientific method. All steps should be included in the story somewhere and also the three main components of experimental design should be included. Students should NOT identify the steps or main components, we will do this tomorrow in class. Students may choose any school appropriate topic and explain an experiment that could be carried out to investigate the topic.

May be hand written neatly or typed, no word limit, just must include all steps and components.
